

## **JAVA OOP: LAB2**

Design the Employee class including 5 properties name, age, address, salary, salary coefficient and methods of initialization, information input, salary calculation (Salary= basic salary \* salary coefficient). Know that: basic salary=1.050.000.

Write programs use Array datastructure allow:

1. Input information for 10 employees
2. Display information for each employee
3. Calculate the total salary.
4. Sort Employee descending by name.
